

Bullying Among Children

Janis R. Bullock

Janis R. Bullock is Professor, Early Childhood Education, Department of Health and Human Development, Montana State University, Bozeman.

Most teachers are aware that bullying begins early, yet many appear to believe the myth that children “picking on” or teasing one another is a “normal” part of childhood.

Six-year-old Sam is barely eating. When asked by his dad what is wrong, he bursts into tears. “The kids at school keep calling me a nerd, and they poke and push me,” he sobs.

“There’s a kid at school no one likes,” 7-year-old Anika shares with her parents. “We all tease her a lot. She is a total dork. I would never invite her to my birthday party.”

Bullying is a very old phenomenon; European researchers have studied its effects for decades (Olweus, 1991). Until recently, however, the issue has received less attention from researchers in the United States, perhaps because of the prevailing belief that bullying among children is inevitable. Considering that bullying often is a sign that aggressive or violent behavior is present elsewhere in children’s lives—young children may be acting out at school what they have observed and learned in the home—and the fact that bullying among primary school-age children is now recognized as an antecedent to progres-

sively more violent behavior in later grades (Saufier & Gagne, 2000), it behooves teachers to take notice.

Unfortunately, teachers have differing attitudes toward children who bully. Most teachers are aware that bullying begins early, yet many appear to believe the myth that children “picking on” or teasing one another is a “normal” part of childhood. They also may believe that these conflicts are best resolved by the children themselves. Consequently, some teachers do not intervene.

CHARACTERISTICS OF BULLIES AND THEIR VICTIMS

Bullying refers to repeated, unprovoked, harmful actions by one child or children against another. The acts may be physical or psychological. Physical, or direct, bullying includes hitting, kicking, pushing, grabbing toys from other children, and engaging in very rough and intimidating play. Psychological bullying includes name calling, making faces, teasing, taunting, and making threats. Indirect, or less obvious and less visible, bullying includes exclusion and rejection of children from a group (Olweus, 1991).

Children who bully are impulsive, dominate others, and show little empathy. They display what Olweus (1991) defines as an “aggressive personality pattern combined with physical strength” (p. 425). Without intervention, the frequency and severity of the bullying behaviors may increase. Even more disturbing, it appears that the patterns of bullying learned in the early years can set children on a course of violence later in life (Batsche & Knoff, 1994; Baumeister, 2001).

Although a longstanding characterization of children who bully points to their low self-esteem, there is little em-

pirical evidence to support this view. In fact, more recent research (Baumeister, 2001; Bushman & Baumeister, 1998) suggests that an inflated self-esteem increases the odds of aggressive behavior. When a bully's self-regard is seriously threatened by insults or criticisms, for example, his or her response will be more aggressive than normal. Furthermore, bullies often report that they feel powerful and superior, and justified in their actions.

Research on family dynamics suggests that many children already have learned to bully others by preschool age. Many young children who bully lack empathy and problem-solving skills, and learn from their parents to hit back in response to problems (Loeber & Dishion, 1984; Vladimir & Brubach, 2000).

Children who are bullied, on the other hand, are often younger, weaker, and more passive than the bully. They appear anxious, insecure, cautious, sensitive and quiet, and often react by crying and withdrawing. They are often lonely and lack close friendships at school. Without adult intervention, these children are likely to be bullied repeatedly, putting them at-risk for continued social rejection, depression, and impaired self-esteem (Schwartz, Dodge, & Coie, 1994). A smaller subset of these children, known as "provocative victims," have learned to respond aggressively to perceived threats by retaliating not only against the aggressor, but also against others (Olweus, 1993).

INCIDENCES OF BULLYING AMONG CHILDREN

Evidence suggests that, in the United States, the incidence of bullying among children is increasing and becoming a nationwide problem. One out of five children admits to being a bully (Noll & Carter, 1997). In general, boys engage in more physical, direct means of bullying, whereas girls engage in the more psychological and indirect bullying, such as exclusion. Roland (1989) reported that girls may be involved in bullying as much as boys, but are less willing to acknowledge their involvement. In addition, because indirect bullying is often less apparent, girls' bullying may be underestimated. Girls tend to bully less as they get older. The percentage of boys who bully, however, is similar at different age levels (Smith & Sharp, 1994).

Twenty-five to 50 percent of children report being bullied. The great majority of boys are bullied by other boys, while 60 percent of girls report being bullied by boys. Eight percent of children report staying away from school one day per month because they fear being bullied. Forty-three percent of children have a fear of being harassed in the school bathroom (Noll & Carter, 1997). Children report that many incidents of bullying occur in situations that are

difficult for the teacher to monitor, such as during playground activity.

THE EFFECTS OF BULLYING ON CHILDREN

To succeed in school, children must perceive their environment as being safe, secure, and comfortable. Yet, for many children, bullying and teasing begins as soon as children first form peer groups. For some children, this is a time when patterns of victimizing and victimization become established. Consequently, the victims perceive school as a threatening place and experience adjustment difficulties, feelings of loneliness, and a desire to avoid school. These feelings may linger even when bullying ceases (Kochenderfer & Ladd, 1996).

Children desire and need interaction with peers, physical activity, and time outdoors. Consequently, they often consider outside recess to be their favorite part of the school day. Sadly, however, many children who are bullied report that problems occur on the playground and view the playground as a lonely, unhappy, and unsafe environment.

If children are fearful or feel intimidated, they cannot learn effectively. They may react by skipping school, avoiding certain areas of the school (the bathroom or the playground), or, in extreme, yet increasingly common, cases, they may bring weapons to school (Noll & Carter, 1997). Olweus (1991) reminds us that "every individual should have the right to be spared oppression and repeated, intentional humiliation in school, as in society at large" (p. 427). As early exposure to bullying can produce both immediate and delayed effects in children's ability to adjust to school, school staff need to intervene as soon as problems are detected.

RECOMMENDATIONS FOR TEACHERS TO SUPPORT CHILDREN

A comprehensive plan to address the problems of bullying and teasing must involve school personnel, teachers, children, and families. Intervention must occur on three levels: school-wide, in specific classrooms, and with individuals.

School-wide Intervention

School personnel must recognize the pervasiveness of bullying and teasing and its detrimental effects on children's development. Inservice training can be developed that outlines a clear policy statement against bullying and intervention strategies for addressing it. The school also can de-

velop a comprehensive plan geared to teach children prosocial behaviors and skills. The children may be involved in the development of such policies and strategies, providing their input on what behavior is appropriate and identifying sanctions against bullies (Lickona, 2000; Olweus, 1997).

School personnel could enlist families' support and involvement by sharing details of the policy through parent-teacher conferences and newsletters. Families need to be aware of the specific sanctions that will be imposed on children who bully, and they need opportunities to offer feedback and suggestions. It is important to encourage parents to talk with their children about bullying. Children who are bullied often believe that their parents are unaware of the situation, and that their concerns are not being addressed or discussed. Children *do* want adults to intervene, however (Groppe & Froschl, 1999). If families are kept informed, they can work as a "team member" with school counselors and teachers to change the school environment.

Additional sources of school-wide support for children who are bullied and teased may be developed, including mentoring programs. Teachers can identify children who need support, and find them a mentor. Children may feel more at ease and less anxious when they have a "buddy," such as an older student, who can help intervene (Noll & Carter, 1997). Counselors at one elementary school selected, trained, and supervised high school students to teach the younger children how to deal with bullying and harassment. After implementation of this program, the teachers observed a decline in reports of harassment (Frieman & Frieman, 2000).

Bullying frequently occurs on the playground (Whitney, Rivers, Smith, & Sharp, 1994), yet many children believe that teachers do little to stop it. Consequently, "play-time...is more of a prison sentence than an opportunity to play and socialize" (Slee, 1995, p. 326). Therefore, school personnel may need to review playground design and space, children's access to these spaces, teacher supervision, and the role of the school in early intervention on the playground (Lambert, 1999). Yard monitors and lunch time supervisors can be trained to watch for signs of bullying. In addition, children can be asked to identify those places where bullying most frequently occurs.

someone who was being bullied, 37 percent replied that it was none of their business to help (Slee & Rigby, 1994).

Teachers can ask children to talk about what makes them feel unsafe or unwelcome in school. The teacher then can make a list of the children's responses, discuss them (e.g., "I don't like it when someone hits me or calls me a name"), and create corresponding rules (e.g., "Hitting and name calling are not allowed in the classroom"). When necessary, the discussions can be continued during class meetings so that the rules can be reviewed, revised, and updated. The teacher can also show children what to do to help themselves or other children, and remind them of the consequences of breaking the rules. Teachers can reduce children's anxiety by setting firm limits on unacceptable behavior (Froschl & Sprung, 1999).

If the bullying continues, teachers may need to make referrals to school counselors who will work with children, either individually or in groups, to talk about concerns, discuss solutions and options, and give suggestions on how to form friendships. Children without close friends are more likely to be victimized and may benefit from specific suggestions for building friendships (e.g., invite a friend to your house, work together on a school project, share a common interest, play a favorite game together).

Certain types of curricula, especially those that provide opportunities for cooperative learning experiences, may make bullying less likely to flourish. Children need to be engaged in worthwhile, authentic learning activities that encourage their interests and abilities (Katz, 1993). When they are intellectually motivated, they are less likely to bully. For example, project work (Katz & Chard, 2000) involves children's in-depth investigations into topics of their own choosing. As they explore events and objects around them in the classroom, in the school yard, in the neighborhood, and in the community, they learn to cooperate, collaborate, and share responsibilities. Project work can be complemented by noncompetitive games, role playing, and dramatization to raise awareness of bullying and increase empathy for those who experience it. Some teachers use children's literature to help create caring and peaceful classrooms (Morris, Taylor, & Wilson, 2000).

INTERVENTION IN SPECIFIC CLASSROOMS

Clearly, bullying and hurtful teasing affects children's ability to learn and enjoy play, as well as the teacher's ability to teach. Within the classroom, teachers can begin addressing the problem by creating times for children to talk about their concerns. Interestingly, one study showed that when children ages 5 to 7 years of age were asked about assisting

INTERVENTION WITH INDIVIDUALS

Developing both immediate and long-term strategies for identifying and working with bullies may be necessary. When teachers observe an incident of bullying, they can intervene by asking the bully to consider the consequences of his or her actions and think about how others feel. By talking calmly, yet firmly, to the bully, the teacher can make it

clear that such behavior is unacceptable. Teachers can show the bully alternate ways to talk, interact, and negotiate; at the same time, they can encourage victims to assert themselves. By doing so, the teacher is showing the bully and the victim that action is being taken to stop the bullying. Acting promptly can prevent the bullying from escalating.

When interacting with children on a one-on-one basis, teachers should provide encouragement that acknowledges specific attributes, rather than dispensing general praise, approval, or admiration ("I am so glad that you have done a great job; it is wonderful; yours is one of the best projects") that may appear to be contrived. Expressions of specific encouragement ("You seem to be pleased and very interested in your project, and it appears you have worked on it for many days and used many resources to find answers to your questions"), as opposed to general praise, are descriptive, sincere, take place in private, focus on the process, and help children to develop an appreciation for their efforts and work. While developing children's self-esteem is a worthwhile goal, false praise may instead promote narcissism and unrealistic self-regard. Teachers should avoid encouraging children to think highly of themselves when they have not earned it (Baumeister, 2001; Hitz & Driscoll, 1988).

Additional long-term strategies may include encouraging children to resolve their own problems and using peers to mediate between bullies and their targets. Furthermore, teachers can spend time helping children to form ties with peers who can offer protection, support, security, and safety, thus helping to reduce children's exposure to bullying (Kochenderfer & Ladd, 1997; Ladd, Kochenderfer, & Coleman, 1996).

SUMMARY

Bullying and teasing are an unfortunate part of too many children's lives, leading to trouble for both bullies and their victims. Children who are bullied come to believe that school is unsafe and that children are mean. They may develop low self-esteem and experience loneliness. Children who continue to bully will have difficulty developing and maintaining positive relationships. A comprehensive intervention plan that addresses the needs of the school, the classroom, teachers, children, and families can be developed and implemented to ensure that all children learn in a supportive and safe environment.
